## Full Length Research Paper

# Medico-Ethnobotanical inventory of Ogii, Okigwe Imo State, South Eastern Nigeria - I

## **Durugbo Ernest Uzodimma**

Department of Biological Sciences, Redeemer's University, Mowe, Ogun State, Nigeria. E-mail: ernestduru@yahoo.com, durugboe@run.edu.ng; Phone: +234-8037207752

Accepted 25 October, 2013

Due to the renewed interest in medicinal plants research resulting from the resistance of malarial parasites as well as antibiotics to known drugs, this study was carried out to document the different medicinal plants used by the indigenes of Ogii in Okigwe, Imo State Nigeria to treat different ailments which complements orthodox medicine which is expensive and not readily available. Information on these plants were readily available with the older generation, hence the need to gather and document these data as soon as possible and also highlight the need for the conservation of plant resources. The different plants were collected during field trips in July and November 2008 as well as April and December 2009. A total of seventy three species mostly trees and shrubs belonging to thirty eight families and sixty eight genera were found useful to the people for curing different human diseases as well as other purposes. The most diverse families were Euphorbiaceae, Annonaceae and Fabaceae with seven genera for the former and six each for the other two. Members of the Annonaceae appeared the commonest species used in malarial treatment suggesting the presence of antiplasmodial substances in this family and the need to extract and characterize such for posterity. The survey was carried out using a structured guestionnaire administered to local herbalists (ethnomedicinal practitioners) as well as some elderly men and women. The information provided in this paper included the botanical names, local names, family names, life forms, and parts of the plants used for medicinal purposes. Most of the plants were already known. The dried, pressed, and mounted specimens were deposited in the temporary herbarium of the Redeemer's University after proper authentication by Mr. B.O. Daramola and Mr. T. Odewo at the University of Lagos Herbarium.

**Keywords:** ethnobotany, antiplasmodial, medicinal plants, malaria, Ogii.

### INTRODUCTION

In developing countries where modern western medicine is expensive, most of the indigenes rely on indigenous plants for the treatment of various ailments. Medicinal plants have been used since prehistoric times for the cure of different ailments (Qureshi *et al.* 2009). Again, with the ever changing resistance of malarial parasites to modern medicines coupled with the well documented cases of antibiotic resistance (Wongsrichanalai *et al.* 2002; Okeke, 2003; Shittu, *et al.* 2011), the locals resort

to the combined use of different medicinal plants to curb this menace. Ogii Okigwe is inhabited by Igbo speaking people of Southeastern Nigeria. The area belongs to the humid tropic having the two peculiar dry and rainy seasons respectively. Though several workers have documented medicinal plants from south eastern Nigeria, the information is scanty compared to those from other parts of the country (Ibe and Nwufor,2005; Obute, 2005; Ndukwu and Ben-Nwadibia, 2005; Edeoga, 2007;

Okujagu et al. 2008; Ogbonna et al. 2008; Njowundu et al. 2010; Nwosu, 2002). Moreover, nothing has been documented from Okigwe generally. This present study is undertaken to first document the different plants and their parts used by the local Ogii community in treating different diseases as well as the preparation methods and dosages. This will pave way for further research on these plants to identify and isolate the different active ingredients contained in them especially as the search for more effective malarial drugs continues. The information contained herein will also highlight the contributions of some plants to the general healthcare of the people of Ogii-Okigwe.

#### **MATERIALS AND METHODS**

The study was conducted at the Ogii community located in the Okigwe local government area of Imo state Nigeria (latitude 5° 47′ N and 7° 21′E). A structured questionnaire (Appendix 1) was prepared and administered to local herbalists (ethnomedicinal practitioners) as well as some elderly men and women who are more familiar with the medicinal uses of these plants than the younger generations. Two herbalists and fifty elderly people the majority of which were males the (36) were involved. The different plants were collected and shown to them for which they gave the medicinal and other uses. Most of their claims agreed together revealing the common use of some of the plants.

#### Collection of ethnomedicinal data

Ogii area was surveyed during field trips in July and November 2008 as well as April and December 2009 and the specimens were collected. The questionnaire (Appendix 1) was designed to extract information from the elderly and trado-medicinal practitioners. The elderly were chosen because they are more familiar with the uses of these plants than the younger generations who resort more to orthodox medicine. Bardshah and Hussain (2011) had highlighted the loss of information on medicinal uses of plants as the older generations die since they are more knowledgeable than the younger generations. Again the younger generations prefer western medicines to these local ones due to spiritual inclinations and the notion that herbal medicines are always associated with idol worship, together with the belief that the dosages for these herbal remedies are not reliable.

Identification of the collected specimens were done using Flora of West Tropical Africa (Hutchinson and Dalziel, 1954, 1968); Nigerian Trees (Keay *et al.* 1954); Outlines and Pictures of Medicinal plants in Nigeria (Odugbemi, 2006,2008); Handbook of African Medicinal Plants by Iwu, 1993; Medicinal plants of Nigeria (South-

East) By Okujagu *et al.*, (2009).; and Guide to West African Weeds by Akobundu and Agyakwa,1987. The unknown ones were correctly identified and authenticated by Mr. Benjamin Daramola and Mr. Thomas Edewo at the Herbarium of the University of Lagos. All the collected plant specimens were pressed, dried, mounted on sheets and deposited in the temporary herbarium of the Redeemer's University after proper authentication by Mr. B.O. Daramola and Mr. T. Edewo at the University of Lagos Herbarium.

#### **RESULTS**

A total of seventy three (73) plant species were studied and the local names, family, uses and parts of the plant used are enumerated below. The commonest families were Euphorbiaceae, Fabaceae, Annonaceae, and Rubiaceae (Table 1) with a total of seven, seven, six and four genera respectively. While Euphorbiaceae and Fabaceae were represented by seven species, Annonaceae, and Rubiaceae were represented each by six and four species. Of these seventy three species, 36 were trees, 19 shrubs, 10 herbs and 8 climbers. Figure 1 shows the percentage occurrence of each life form studied. Table 2 summarizes the different diseases and their associated species. Of the fifty two respondents, 65% were above 60 years, while 35% were between 45 and 60 years. They more elderly ones were able to recognize above sixty of the seventy three plants studied. Majority of them attested to having not suffered from serious toothache as they use chewing sticks daily.

1. Botanical name: Napoleona imperialis P. Beauv.

Local name: Nkpodu Family: Lecythidaceae Life form: Shrub

Part used: Fresh leaves, stem, roots, fruit

Specimen No: RH001

Ethno-botanical uses: Matured fruit edible. Fresh leaves chewed for stomach ache. Roots boiled with "Usu" (*Pleurotus tuberregium*) and drunk for treatment of chest and heart pains.

2. Botanical name: Burkea africana Hook.

Local name: Ofo

Family: Fabaceae subfam. Caesalpinioideae

Life form: Tree

Part used: Bark, seeds Specimen No: RH002

Ethno-botanical uses: Stem bark ground together with potash and boiled, taken while hot for seven days to cure tuberculosis. Also combined with ground leaves of "Anya nnunu" *Abrus precatorius* and potash and the mixture licked for treatment of tuberculosis. Seeds boiled and ground and used as soup condiment/thickener.

3. Botanical name: Anthocleista djalonensis A. Chev.

Local name: Oabeduga Family: Loganiaceae Life form: Tree

Part used: Root, leaves Specimen No: RH003

Ethno-botanical uses: Root boiled together with "Osisikaguru" Strophanthus hispidus and taken for swollen stomach and oedema. Again, roots boiled and taken for venereal diseases. Leaves used as fodder for livestock.

4. Botanical name: Strophanthus hispidus (D. C.)

Local name: Osisikaguru Family: Apocynaceae Life form: Climber

Part used: Stem, leaves, seeds

Specimen No: RH004

Ethno-botanical uses: A multipurpose medicinal plant. Stem and leaves boiled with palm wine for the treatment of swollen stomach and burning sensation in heart. Half part of a tumbler taken thrice daily for one week. Seeds ground and put in bottle with gin and taken morning and night for eight days for treatment of heart disorders. Added to other preparations to treat different ailments.

5. Botanical name: Brachystegia eurycoma Harms

Local name:

Family: Fabaceae subfam. Caesalpinioideae

Life form: Tree

Part used: Seeds. roots Specimen No: RH005

Ethno-botanical uses: Roots infused in gin, I shot taken morning and night for seven days to treat infertility. Roots ground with Abrus precatorius to treat cough. Roots also used in the preparation of good luck charms. Matured seeds boiled or roasted, ground and used as soup condiment.

6. Botanical name: Dennettia tripetala (Bak,) F.

Local name: Nmimmi Family: Annonaceae Life form: Tree

Part used: Roots, leaves, seeds

Specimen No: RH006

Ethno-botanical uses: Cut roots combined with "odu- agu" Uvaria chamae roots put in bottle with gin, one half tumbler taken thrice daily for arthritis treatment. Leaves boiled and used to bathe for malaria. Seeds edible, served as kola to visitors.

7. Botanical name: Newbouldia laevis (P. Beauv.)

Seemann ex Bureau Local name: Ogirisi Family: Bignoniaceae Life form: Tree

Part used: Leaves

Specimen No: RH007

Ethno-botanical uses: Leaves boiled with bark of "ugba" Pentacletra macrophylla and bark of "osisikaguru" Strophanthus hispidus for the treatment of abscesses. Leaves warmed over fire and applied on dislocations. Root scraped, squeezed and put on wound to stop bleeding.

8. Botanical name: Icacina trichanta Oliv.

Local name: Ori-agbo Family: Icacinaceae Life form: Shrub Part used: Leaves, tuber Specimen No: RH008

Ethno-botanical uses: Fresh leaves boiled and drunk for malaria. Tuber used in combination with other herbs for

9. Botanical name: Olax subscoroidea Oliv.

Local name: Atu nwa nkapi

Family: Olacaceae Life form: Shrub Part used: Roots, stems Specimen No: RH009

Ethno-botanical uses: Stem used as chewing stick for toothache, stems and branches used as broom. Roots

used treat impotence in men.

10. Botanical name: Morinda lucida Benth.

Local name: Nne mmanu

Family: Rubiaceae Life form: Tree

Part used: Bark, Leaves Specimen No: RH010

Ethno-botanical uses: Infusion of the leaves and bark used to treat malaria and typhoid fever. Bark boiled for treatment of itching of private part in women. Leaves also used as fodder for goats.

11. Botanical name: Alstonia boonei De Wild.

Local name: Egbu Family: Apocynaceae Life form: Tree Part used: Bark. Specimen No: RH011

Ethno-botanical uses: Bark ground with alligator pepper and placed for embrocating painful part of body or broken arm or leg.

12. Botanical name: Khaya senegalensis (Desr.) A. Juss.

Local name: Mahogany Family: Meliaceae Life form: Tree Part used: Bark. Specimen No: RH 012

Ethno-botanical uses: Bark boiled in pot with little quantity of local chalk "nzu". I shot (small tumbler) taken thrice

daily for treatment of chest /heart pains.

13. Botanical name: Chromolaena odorata (L.) R.M. King

and Robinson

Local name: Obiarakara Family: Asteraceae Life form: Herb Part used: Leaves Specimen No: RH013

Ethno-botanical uses: Leaves squeezed and applied on

fresh cuts to stop bleeding.

14. Botanical name: Spondias mombin Linn.

Local name: Ujukere Family: Anacardiaceae

Life form: Tree

Part used: Leaves, fruits, bark

Specimen No: RH014

Ethno-botanical uses: Stems used in fence making. Ripe yellow fruits edible. Leaves used as fodder for goats but not newly pregnant females, causes abortion. Also used to remove placenta after delivery. Bark used for the treatment of venereal diseases, dysentery and diarrhea.

15. Botanical name: Uvaria chamae P. Beauv.

Local name: Odu- agu Family: Annonaceae Life form: Shrub

Part used: Stem bark, leaves, fruits.

Specimen No: RH015

Ethno-botanical uses: Ripe fruits edible. Leaves and bark boiled and taken for malaria.

Stem bark also used as alternative rope to tie firewood. Roots used to treat venereal diseases.

16. Botanical name: Gongronema latifolium Benth.

Local name: Utazi Family: Asclepiadaceae Life form: Climber Part used: Leaves Specimen No: RH016

Ethno-botanical uses: Leaves used as vegetable, for preparation of pepper soup, yam stew, used together with other spices for postpartum women and treatment of stomach aches.

17. Botanical name: Piper guineense Schum. and Thonn.

Local name: Uzuza Family: Piperaceae Life form: Climber Part used: Leaves, fruits Specimen No: RH017

Ethno-botanical uses: Leaves and fruits used for pepper soup and ordinary soup making. Sold as source of revenue in big markets. Combined with other herbs for treatment of impotence.

18. Botanical name: Piper umbellatum Linn.

Local name: Njamunja Family: Piperaceae Life form: Shrub Part used: Leaves Specimen No: RH018

Ethno-botanical uses: Leaves boiled with "Uzuza" *Piper guineense* and yam. The preparation taken five days for the treatment of dry and chesty coughs. Leaves also combined with bark of "Ofo" *Burkea* occasionally to treat tuberculosis.

19. Botanical name: *Xylopia aethiopica* (Dunal.) A. Rich.

Local name: Uda Family: Annonaceae Life form: Tree Part used: Fruits Specimen No: RH019

Ethno-botanical uses: Fruits used in combination with *Piper nigrum*, *Tetrepleura tetraptera*, *Capsicum frutescens* to prepare concoction for woman who newly delivered, believed to help in uterus contraction.

20. Botanical name: *Tetrapleura tetraptrera* Taub.

Local name: Nkpokoro nwa ohio hio

Family: Leguminosae Life form: Tree Part used: Fruit Specimen No: RH020

Ethno-botanical uses: Fruit burnt to drive away soldier ants and mosquitoes. Also used as spice to cook for newly delivered women.

21. Botanical name: *Microdesmis puberula* Hook. F. ex. Planch.

Local name: Kpirimbo Family: Euphorbiaceae Life form: Shrub Part used: Leaves Specimen No: RH021

Ethno-botanical uses: Leaves combined with *Ceiba* leaves and boiled for fever. Leaves also used as fodder for goats, highly preferred over others by livestock.

22. Botanical name: *Daniellia oliveri* Rolfe. Hutch. & Dalziel

Local name: Inyima Family: Fabaceae Life form: Tree

Parts used: Roots, bark and leaves.

Specimen No: RH022

Ethno-botanical uses: Roots and bark used as antidote for poison. Roots boiled with potash for urinary tract infections. Bark boiled for stomach disorders (stooling). Cut stems used to carve mortars for pounding yam, foo foo etc.

23. Botanical name: Margaritaria discoidea (Baill.) Muell.

Arg.

Local name: Ibishi Family: Euphorbiaceae

Life form: Tree Part used: Leaves Specimen No: RH023

Ethno-botanical uses: Bark boiled and used as purgative to clean the system. Leaves used as fodder for

goat.

24. Botanical name: *Glyphaea brevis* (Spreng)

Monachino

Local name: Ara anyasi

Family: Tiliaceae Life form: Shrub

Parts used: Stem, bark and leaves.

Specimen No: RH024

Ethno-botanical uses: Stem used as cane during masquerade festival. Bark scraped and boiled with leaves for fever, venereal diseases and toothache treatments.

25. Botanical name: Zingiber officinale Rose.

Local name: ....Ginger Family: Zingiberaceae Life form: Herb Part used: Whole Specimen No: RH025

Ethno-botanical uses: To cure migraine. Scrape and

crush, place on eyelids, and face, open eyes several times, and close again to feel impact.

26. Botanical name: Cola millenii K. Schum.

Local name: Oji nwa nnabe

Family: Sterculiaceae Life form: Tree

Part used: Fruits, leaves Specimen No: RH026

Ethno-botanical uses: Ripe fruits edible. Leaves boiled

and taken for treatment of venereal diseases.

27. Botanical name: Berlinia grandiflora (Vahl) Hutch and

Dalz.

Local name: Ububa Family: Fabaceae Life form: Tree

Part used: Bark or leaves Specimen No: RH027

Ethno-botanical uses: Bark or leaves boiled for malarial bathing. Bark boiled and used for treatment of stomach upset.

28. Botanical name: Elaeis guineensis Jacq.

Local name: Nkwu Family: Arecaceae Life form: Tree Part used: Different parts Specimen No: RH028

Ethno-botanical uses: Fronds used to make brooms for sweeping. Mature stem used for building and also tapped for palm wine which is used to infuse most herbal preparations. The ripe fruits used to prepare palm oil for home cooking, and industrial uses. Palm oil taken as antidote for poison. Extracts from palm oil preparation used as anti poison, and for warding off evil spirits. Palm kernels cracked and husks used for sand filling and as fuel for fires, the kernel boiled to prepare palm kernel oil which is used as body cream and as a potent multipurpose medicine especially dropped in the eyes and anus as well as rubbed on the bodies of convulsing children to effect healing. Bark of fronds cut and used to weave baskets for storage and movement of marketable farm products. Fresh ripe fruits roasted in fire and eaten to for relief from cough and as sleep inducing agent.

29. Botanical name: Ocimum gratissimum Linn.

Local name: Nchu anwu Family: Lamiaceae Life form: Herb Part used: Leaves Specimen No: RH029

Ethno-botanical uses: Popular leafy vegetable, used to spice different food preparations and in the preparation of pepper soups. Leaves squeezed into cup and taken for instant relief from stomach upset, also applied onto umbilical cord of babies to sterilize them and prevent infection. Leaves also squeezed and inhaled for relief from catarrh. Leaves also burnt to drive away mosquitoes hence the name. Mixed with mistletoes from Cola too treat diabetes.

30. Botanical name: Ricinus communis Linn.

Local name: Nkpikpi Family: Euphorbiaceae

Life form: Shrub

Part used: Seeds, roots Specimen No: RH030

Ethno-botanical uses: Seeds used to prepare soup condiment "ogiri". Roots boiled with potash to treat venereal diseases. Oil from seeds used medicinally at home and industry.

31. Botanical name: Monodora tenuifolia (Benth.) W.

Local name: Osisi ogiri/Ehuru

Family: Annonaceae Life form: Tree Part used: Seeds Specimen No: RH031

Ethno-botanical uses: Seeds fried and ground to prepare condiment for eating kolanuts. Used in pepper soups. Seeds also chewed and put on forehead to stop

headache. Stem chewed for toothache.

32. Botanical name: Abrus precatorius Linn.

Local name: Anya nnunu

Family: Leguminosae Life form: Climber Part used: Leaves Specimen No: RH032

Ethno-botanical uses: Infusion of the leaves used to

treat whopping cough.

33. Botanical name: Costus afer Ker-Gawl.

Local name: Okpoto Family: Zingiberaceae Life form: Shrub

Part used: Fresh stems, leaves

Specimen No: RH033

Ethno-botanical uses: Fresh stem chewed for cough, leaves used to wrap sliced oil bean seeds to ferment and improve taste.

34. Botanical name: Physalis angulata Linn.

Local name: Ogwu ari Family: Solanaceae Life form: Herb Part used: Leaves Specimen No: RH034

Ethno-botanical uses: Leaves squeezed and put inside folded *Newbouldia laevis* leaves and dropped in eyes for the treatment of eye infections, redness of eye,

scratching of eyes("ari anya").

35. Botanical name: Carica papaya Linn.

Local name: Okwuru bekee

Family: Caricaceae Life form: Tree Part used: Every part Specimen No: RH035

Ethno-botanical uses: Ripe fruit edible. Fresh leaves and ground potash used for the treatment of witlow, leaves boiled with *Mangifera indica, Cympopogon citratus* and *Citrus aurantifolia* for typhoid and malaria. Stem and roots boiled for venereal diseases. Unripe fruits eaten for malaria. Seeds crushed and used to make face look smooth.

36. Botanical name: Raphia vinifera P. Beauv.

Local name: Ngwo Family: Arecaceae Life form: Tree

Part used: Exudate from wounded stem, stem, sap.

Specimen No: RH036

Ethno-botanical uses: Sap used as palm wine and also boiled for gin production. Exudate from wounded stem used to treat whitlow. Stem and fronds used for building. Cut and rotted stem source of raphia maggots which are edible and put in water fed to babies, believed to have medicinal effects and to make babies grow fat.

37. Botanical name: Raphia hookeri Mann & Wendl.

Local name: Ide Family: Arecaceae Life form: Tree

Part used: Exudate from wounded stem, Stem, fronds

Specimen No: RH037

Ethno-botanical uses: Sap used as palm wine and also boiled for gin production. Exudate from wounded stem used to treat whitlow. Stem and fronds used for building and weaving of local canopy, masquerade wears, hand fans. Fronds used to make canoe paddling poles. Seeds and fruit used by Boys Scouts for decoration.

38. Botanical name: Jatropha curcas Linn.

Local name: Okwe aru Family: *Euphorbiaceae* Life form: Shrub Part used: Root, bark Specimen No: RH038

Ethno-botanical uses: Root or bark boiled with potash for the treatment of impotence, gonorrhea and other venereal diseases. Planted as a hedge plant. Juice very

dangerous to the eyes.

39. Botanical name: Euphorbia heterophylla Linn.

Local name: Ogwu afo Family: *Euphorbiaceae*Life form: Herb

Part used: Leaves Specimen No: RH039

Ethno-botanical uses: Leaves boiled with yam and

used as purgative.

40. Botanical name: Peperomia pellucida (L.) H. B. & K.

Local name: .......... Family: Piperaceae Life form: Herb Part used: Leaves Specimen No: RH040

Ethno-botanical uses: Leaves crushed and applied in between toes to treat athletes' foot. Leaves also applied to wounds to effect healing.

41. Botanical name: Lawsonia inermis Linn.

Local name: Lali Family: Lythraceae Life form: Shrub

Part used: Roots, Leaves Specimen No: RH041

Ethno-botanical uses: Roots boiled with potash and used as abortifacient. Leaves ground and applied as cosmetics on nails.

42. Botanical name: Annona senegalensis Pers.

Local name: Nri nnunu Family: Combretaceae

Life form: Shrub

Part used: Fruits, Bark, fruit Specimen No: RH042

Ethno-botanical uses: Fruits edible. Roots boiled with potash for venereal diseases. Bark boiled for the treatment of dysentery.

43. Botanical name: Senna alata L. (Roxb)

Local name: Ogwu ululoo

Family: Fabaceae Life form: Herb Part used: Leaves Specimen No: RH043

Ethno-botanical uses: Leaves crushed for the treatment of ring worm. The ring worm site is initially scratched before the application of the crushed Senna leaves. Leaves burnt to drive away mosquitoes.

44. Botanical name: Vernonia amygdalina Del. Cent.

Local name: Olugbu Family: Compositae Life form: Shrub Part used: Leaves, Bark Specimen No: RH044

Ethno-botanical uses: Leaves applied to fresh cuts to stop bleeding. Leaf decoction used to treat cough, and also taken for malaria. Leaves squeezed and taken to reduce blood sugar, recommended for diabetics.

45. Botanical name: Bryophyllum pinnatum (Lan.) Oken

Local name: Akwukwo ndu

Family: Crassulaceae Life form: Herb Part used: Leaves Specimen No: RH045

Ethno-botanical uses: Squeezed juice from heated leaves mixed with talc powder for the healing of navels in infants. Leaves crushed and applied on wounds for healing.

46. Botanical name: Alchornea cordifolia (Benth.) Pax and K. Hoffin.

Local name: Ubube Family: Euphorbiaceae

Life form: Shrub

Part used: Leaves, twigs Specimen No: RH046

Ethno-botanical uses: Leaves boiled and used to bathe children with small pox. Leaves also used as fodder for goats. Twigs used as chewing stick to treat toothache.

47. Botanical name: Borassus aethiopium Mart.

Local name: Ebi Family: Arecaceae Life form: Tree

Part used: Fruits. root, leaves

Specimen No: RH047

Ethno-botanical uses: Fruits edible. Root boiled with potash and used to treat swollen testis. Leaves woven to make local hand fan. Matured stem used as timber for building construction.

48. Botanical name: Rothmannia whitfieldii Lindl.

Local name: Uri Family: Rubiaceae Life form: Shrub

Part used: Fruits, roots, bark

Specimen No: RH048

Ethno-botanical uses: Fruits crushed and used to decorate body to heal smallpox. Bark and leaves boiled and used to bathe also for relief from small pox.

49. Botanical name: Hedranthera barteri (Hook. F.) Pichon.

Local name: Amu nkita Family: Apocynaceae Life form: Shrub

Part used: Fruit. roots Specimen No: RH049

Ethno-botanical uses: Root boiled for treatment of venereal diseases. Fruits ground and used as worm expeller.

50. Botanical name: Maesobotrya barteri (Baill.) Hutch.

Local name: Uvune Family: Euphorbiaceae Life form: Shrub Part used: Fruit, stems Specimen No: RH050

Ethno-botanical uses: Ripe fruits edible. Stem used as chewing stick to treat toothache. Roots cut and infused in gin for arthritis. Stems also used for fencing and supporting yam tendrils on the farm.

51. Botanical name: Pterocarpus santalinoides L' Herit. Ex DC.

Local name: Uturukpa

Family: Fabaceae Life form: Tree Part used: Leaves Specimen No: RH051

Ethno-botanical uses: Leaves used as vegetables and as livestock feed for goats.

52. Botanical name: Pterocarpus soyauxii Taub.

Local name: Oha/Ora Family: Fabaceae Life form: Tree Part used: Leaves Specimen No: RH052

Ethno-botanical uses: Fresh leaves used as vegetables and as livestock feed for goats. Fresh leaves also recommended for consistent use by diabetics. Bark

crushed used for treating eczema and ringworm. Matured trees used as timber and for making talking drums used to announce meetings and during masquerade festivals.

53. Botanical name: Cleistopholis patens (Benth)

Engl. And Diels

Local name: Oghuru/Oghulu

Family: Annonaceae Life form: Tree Part used: Bark Specimen No: RH053

Ethno-botanical uses: Leaves combined with *Uvaria* chamae for malarial treatment or stem bark boiled in water with yam and taken for quick relief from malaria.

54. Botanical name: Ceiba pentandra (L.) Gaertn.

Local name: Akpu Family: Bombacaceae

Life form: Tree

Part used: Fresh leaves, stem

Specimen No: RH054

Ethno-botanical uses: Fresh leaves used as vegetable. Bark boiled in water and used for diabetes and erectile dysfunction treatments. The silk used in some medicinal preparations. Matured stem used as timber for construction.

55. Botanical name: Bombax buonopozense P. Beauv.

Local name: Akpu ogiri Family: Bombacaceae

Life form: Tree

Part used: Bark, leaves, stem

Specimen No: RH055

Ethno-botanical uses: Bark and leaves boiled for the treatment of stomach disorder. Roots boiled with potash and roots of *Rauwolfia vomitora* for serious venereal diseases. Matured stem used as timber for construction.

56. Botanical name: Pisidium guajava Linn.

Local name: Gova Family: Myrtaceae Life form: Tree

Part used: Stem, leaves, fruits

Specimen No: RH056

Ethno-botanical uses: Matured fruits edible. Stem used as chewing stick. Leaves boiled with *Cymbopogon citratus*, *Citrus aurantifolia* (sliced fruits/leaves), *Carica papaya*, and *Aziradchita indica* leaves. Hot preparation put in a cup and drank, also poured into basin and patient covered with thick cloth over the steam to sweat for malarial treatment. The preparation boiled and used to bath the following morning and evening for four days. Fresh leaves also chewed to stop stooling.

57. Botanical name: Ficus polita Vahl /F. capensis Thunb

Local name: Ukoro Family: Moraceae

Life form: Tree

Part used: Leaves, Twigs, fruits

Specimen No: RH057

Ethno-botanical uses: Leaves and twigs boiled and left overnight to cool, taken afterwards with malt drink or milk as blood tonic. Leaves also used as fodder for livestock. Fruits edible.

58. Botanical name: Mucuna pruriens (L.) DC

Local name: Agbara ohia Family: Leguminosae Life form: Climber Part used: Leaves, seeds

Specimen No: RH058

Ethno-botanical uses: Fresh leaves squeezed and taken with malt or milk as blood tonic. Seeds swallowed while hunting to prevent snake bite. Leaves used in mulching of farms.

59. Botanical name: Mondia whitei (Hook. F.) Skeels

Local name: Ukukoro Family: Periplocaceae Life form: Climber Part used: Fruit Specimen No: RH059

Ethno-botanical uses: Fruits eaten as fruit vegetable with palm oil. Whole plant boiled for the treatment of pile.

60. Botanical name: Telfaria occidentalis Hook. F.

Local name: Ugu Family: Curcubitaceae Life form: Climber Part used: Leaves Specimen No: RH060

Ethno-botanical uses: Leaves used as vegetable. Old leaves used as fodder for goats. Healthy Fresh leaves squeezed and taken with malt or milk to treat anaemia. Seeds scooped out from matured fruit boiled and eaten as vegetable. Roots very potent poison.

61. Botanical name: Aspilia africana (Pers.) C. D. Adams

Local name: Oranjele Family: Compositae Life form: Herb Part used: Leaves Specimen No: RH061

Ethno-botanical uses: Leaves squeezed and applied to fresh cuts and wounds to stop bleeding. Leaves also used for the treatment of stomach troubles and as fodder for livestock.

62. Botanical name: *Myrianthus arboreus* P. Beauv.

Local name: ujuju Family: Moraceae Life form: Tree

Part used: Stem bark, fruits Specimen No: RH062 Ethno-botanical uses: Ripe fruits edible. Stem bark boiled to treat dysentery and stomach upset.

63. Botanical name: Discorea bulbifera Linn-Holl.

Local name: Adu Family: Discoreaceae Life form: Climber Part used: Aerial tubers Specimen No: RH063

Ethno-botanical uses: Aerial tubers harvested and stored. Eaten during slight famine after planting of yams, cocoyams etc. Tubers also used for spiritual remedy of mental disorders.

64. Botanical name: Canarium schweinfurthii Engl.

Local name: Ube mgba Family: Burseraceae Life form: Tree

Part used: Fruits, bark Specimen No: RH064

Ethno-botanical uses: Fruits softened in boiled water and eaten like black pear. Bark boiled with potash for venereal disease treatment and used to rub limbs of pregnant women with oedema. Matured tree used as timber.

65. Botanical name: Nauclea latifolia Smith.

Local name: Uvuru Family: Rubiaceae Life form: Shrub

Part used: Roots, Fruits, bark

Specimen No: RH065

Ethno-botanical uses: Roots and stem bark boiled with potash for venereal disease treatment. Leaves boiled with other leaves for malarial treatment. Leaves also used as fodder for goat.

66. Botanical name: Mitracarpus villosus (Sw.) DC.

Local name: Ogwu ngwo Family: Rubiaceae Life form: Herb Part used: Leaves Specimen No: RH066

Ethno-botanical uses: Leaves crushed, squeezed and

applied on already scratched eczema surface.

67. Botanical name: Cola lepidota (K. Schum)

Local name: Ochichaa Family: Sterculiaceae Life form: Tree

Part used: Fruits, Leaves Specimen No: RH067

Ethno-botanical uses: Testa of ripe fruits eaten raw or with palm oil for nutrients. Stem bark used for the treatment of pile and stomach disorders in combination with *Citrus aurantifolia*, *Gongronema latifolia* and

Scoparia dulcis. Roots cut in pieces, put in gin and used for arthritis.

68. Botanical name: Enantia chlorantha Oliv.

Local name: Erumeru Family: Annonaceae Life form: Tree Part used: Stem bark. Specimen No: RH068

Ethno-botanical uses: Stem bark boiled in water and taken for malaria. Stems used for supporting yam tendrils on the farm.

69. Botanical name: Garcinia cola Heckel.

Local name: Agbilu Family: Clusiaceae Life form: Tree Part used: Fruits Specimen No: RH069

Ethno-botanical uses: Fruits eaten raw for cough and sore throat. Could also be eaten together with "tom- tom" for faster relief of chesty coughs. Fruit also served as cola to visitors as sign of good will.

70. Botanical name: *Syncepalum dulcificum* (Schum. and

Thonn.)Daniell.

Local name: Ununaa/Ununoo

Life form: Shrub Family: Sapotaceae Part used: Fruits, leaves Specimen No: RH070

Ethno-botanical uses: Leaves and fruits edible. Used to sweeten tongue especially during masquerade festival so as to drink even very sour palm wine which tastes sweet.

71. Botanical name: *Irvinga gabonensis* (Aubry -Lecomte ex O'Rorke) Baillon.

Local name: Ujiri Life form: Tree Family: Irvingaceae Part used: Fruits, stem Specimen No: RH071

Ethno-botanical uses: Testa of matured ripe fruits edible. Stems cut and used as chewing stick.

72. Botanical name: Irvinga woumbolu Vermoesen.

Local name: Ogbono Life form: Tree Family: Irvingaceae Part used: Fruits, stem Specimen No: RH072

Ethno-botanical uses: Testa of matured ripe fruits bitter not edible. Ground seeds used as soup condiment/thickener. Very economic, money yielding crop. Stems cut and used as chewing stick.

 $\textbf{Table 1.} \ \, \textbf{Summary of the different Plant Families; their representative Genera and Species.}$ 

S/No	Families	Total Genera	Number of Species
1	Anacardiaceae	1	1
2	Annonaceae	6	6
3	Apocynaceae	3	3
4	Arecaceae	3	4

Table 2. Summary of different diseases and their associated plant species

Malaria	Venereal diseases	Cough
Uvaria chamae	Ricinus communis	Abrus precatorius
Denettia tripetala	Uvaria chamae	Ocimum gratissimum
Cleistopholis patens	Nauclea latifolia	Piper umbellatum
Enantia chloranta	Anthocleista djalonensis	Piper guineense
Carica papaya	Spondias mombin	Brachystegia eurycoma
Citrus aurantifolia	Cola millenii	Costus afer
Microdesmis puberula	Citrus aurantifolia	Garcinia cola
Glyphae brevis	Carica papaya	Vernonia amygdalina
Morinda lucida	Jatropha curcas	Palm fruits
Icacina trichanta	Hederanthera barteri	Tuberculosis
Psidium guajava	Annona senegalensis	Burkea africana
Nauclea latifolia	Bombax buonopozense	Piper umbellatum
Vernonia amygdalina	Oedema in women	Pile
Berlinia grandiflora	Canarium schweinfurthii	Mondia whitei
Infertility	Anthocleista djalonensis	lcacina trichanta
Olax subscoroidea	Strophanthus hispidus	Cola lepidota
Brachystegia eurycoma	Purgative	Heart related diseases
Ceiba pentandra	Euphorbia heterophylla	Strophanthus hispidus
Piper guineense	Margaritaria discoideus	Napoleona puberula
Post natal preparations	Aborfacient	Khaya senegalensis
Xylopia aethiopica	Lawsonia inermis	
Gongronema latifolium	?Spondias mombin	Swollen testis
Ocimum gratissimum	Ringworm/eczema	Borassus aethiopium
Napoleona puberula	Pterocarpus soyauxii	Diabetes
Piper guineense	Senna alata	Vernonia amygdalina
Tetrapleura tetraptera	Mitracarpus villosus	Pterocarpus soyauxii
Monodora tenuifolia	Stomach disorders	Ocimum gratissimum
Blood tonic/anaemia	Napoleona puberula	Ceiba pentandra
Telfairia occidentalis	Uvaria chamae	Toothache
Mucuna pruriens	Gongronema latifolium	Olax subscoroidea
Ficus polita/capensis	Berlinia grandiflora	Glyphae brevis
Wound healing	Citrus aurantifolia	Monodora tenuifolia
Peperomia pellucida	Myrianthus arboreus	Alcornea cordifolia
Vernonia amygdalina	Bombax buonopozense	Maesobotrya barteri
Chromolaena odorata	Annona senegalensis	Poison antidote
Newbouldia laevis	Aspilia africana	Palm oil
Bryophyllum pinnatum	Embrocation	Daniellia oliveri
Aspilia africana	Alstonia boonei	Arthritis
Witlow	Newbouldia laevis	Maesobotrya barteri
Carica papaya	Dysentary/diarrhoea	
Raphia hookeri	Spondias mombin	Mental disorder
Eye infections	Small pox	Discorea bulbifera
Physalis angulata	Rothmannia whitfieldii	Worm expeller
Newbouldia laevis	Alcornea cordifolia	Hederanthera barteri

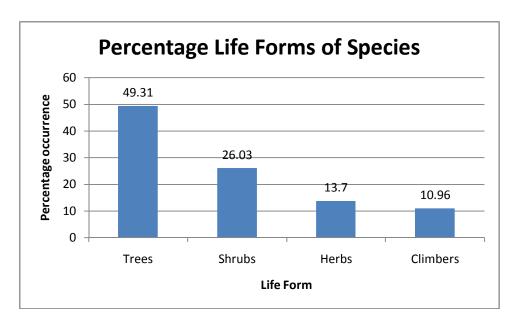

Figure 1. Percentage occurrence of the different life forms

73. Botanical name: Citrus aurantifolia (Christm.) Swingle

Local name: Ujiri nta/ oroma nkirisi

Life form: Tree Family: Rutaceae

Part used: Fruits, leaves, stem

Specimen No: RH073

Ethno-botanical uses: Fruit highly medicinal, added to various medicinal preparations. Used for stomach upset, clean bitter tongue/mouth especially during high fevers. Fruits cut in pieces and added mixed in boiled water with "lipton" teabags for fever treatment. Fruits cut and used to wash male organ after sex to prevent venereal diseases. Leaves and twigs boiled with other leaves for malarial treatment. Twigs also cut and used as chewing stick.

#### **DISCUSSION**

Majority of the different plants used by the people of Ogii have been documented as medicinal plants in other parts of Nigeria (Odugbemi 2006, 2008; Bhat *et al.* 1990; Kadiri *et al.* 2010; Sofowora, 1984, 1993; Ogbole *et al.* 2010; Ubom, 2010 amongst others), with few exceptions like the use of *Cleistopholis patens* in malarial treatment (B. O. Daramola. University of Lagos Herbarium, Oral communication).

Most of the respondents attested to the common use of *Strophanthus hispidus* as a "great medicine" used to strengthen others in medicinal preparations. Its action against heart problem could be due to the presence of a substances similar to the cardiac glycoside strophantin which has been isolated from the ripe seeds of *S. kombe*, a variety of the Genus common in East Africa. This study has highlighted the common use of plants of the

Annonaceae in malarial treatment which calls for further investigation. Possibly this plant family contains an active ingredient which could compete with other malarial drugs in effective treatment of the menace. Liu et al. (1990) had isolated a new alkaloid, 3-methoxysampangine in association with three already known alkaloids, eupolauridine, liriodenine, and eupolauridine N-oxide from the root bark of Cleistopholis patens. The new alkaloid had proved effective against the fungi Candida albicans, Aspergillus fumigatus, and Cryptococcus neoformans. Furthermore, Seidel et al. (1999) had also isolated partially acetylated tri- and tetrarhamnoside dodecanyl ether derivatives from its matured leaves. Possibly the antiplasmodial action attested to by the respondents could be caused by the presence of these elements, though further investigations using the stem bark which was what most respondents claim to use need to be carried out.

Some of the information gathered from the Ogii respondents agrees with those from other southeastern Nigerian villages revealing common use of these plants especially *Telfairia occidentalis, Gongronema latifolium, Elaeis guineensis* kernel extract in treating convulsion in children, *Ocimum gratissimum, Uvaria chamae, Denettia tripetala* and *Ricinus communis* (Obute, 2005; Okujagu, *et al.* 2008; Ibe, and Nwufo, 2005, amongst others).

An assessment of earlier workers when compared to the present revealed some areas in which the results are close indicating the common use of some of these plants in southeastern Nigeria, while for some like Costus afer, Cleistopholis patens, Cola lepidota, Canarium schweinfurthii, Piper umbellatum, Burkea africana and Spondias mombin, the information contained here from available literature are new to the knowledge of south

eastern Nigerian medicinal plants. Furthermore, the linking of Burkea africana and Piper umbellatum with the treatment of leprosy and tuberculosis is worth investigating going by the deleterious effects of the diseases on humanity. Since the Genera of organisms responsible for leprosy and tuberculosis are similar, the combined therapy of both plants should be tested on Mycobacterium leprae and M. tuberculosis. Annually, Nigeria spends a lot of foreign exchange on the importation of ergometrine derived from the ergot of rye (Claviceps purpurea) which is used medically for placental ejection after delivery and stoppage of bleeding, the respondents have pointed out the potentials of Spondias mombin in delivery of placenta after birth in goats. The need to verify this claim and possibly isolate a substance similar to ergometrine which would reduce the amount of money spent on importation will be a worthwhile research.

In response to Avodele (2005) and Odugbemi (2008) assertions, the need for scientists to indulge in extensive research to ascertain whether what these locals have said concerning the medicinal properties of these plants were true need not be over emphasized. Okujagu et al. (2008) had made remarkable progress in testing and documenting the active ingredients such as alkaloids, tannins, saponins, phenols, etc present in some of these medicinal plants. Edeoga et al. (2005) had also investigated the active ingredients in Sida acuta, Emilia Cleome rutidosperma, Scoparis dulcis, coccinea, Euphorbia heterophylla, Tridax procumbens, Richardia bransilensis, Spigelia anthelmia, Physalis angulata, and Stachytarpheta cayenensis. Steroids and phlobatannins were the most common ingredient they found of which steroids are useful in relation to sex hormones.

Though Ogbonna et al. (2008) had investigated the antimalarial properties of selected herbs southeastern Nigeria using only three out of the numerous plants associated with malarial treatment, majority of the plants they used were encountered in this study and the performance of Nauclea latifolia and Enantia chloranta in vivo proves their efficacy as good malarial remedies thereby confirming the claims of the respondents. Aderounmu (2002) had also reported the efficacy of Enantia chloranta together with Cymbopogon giganteus, Azadirachta indica and Morinda lucida in treating malaria caused by the most deadly malaria parasite Plasmodium falciparum (Krettli, 2001).

Obute and Adubor, 2007 had investigated the chemical constituents of about seventeen medicinal plants from southeastern Nigeria. They isolated phenols and flavonols which are the substances that confer these medicinal properties on these plants. Among the plants they studied that were encountered in this survey were Vernonia amygdalina, Psidium guajava, Chromoleana odorata, Carica papaya, Telfairia occidentalis, Mangifera indica, Aspilia africana, and Newbouldia laevis. Their findings justified the use of these plants in traditional

medicine.

Though Ndukwu and Ben-Nwadibia (2005) had recorded *Xylopia aethiopica*, *Piper guineense*, *Piper nigrum*, *Piper umbellatum*, *Zingiber officinale*, *Tetrapleura tetraptera Ocimum gratissimum*, *Dennettia tripetala* among spices used by Niger Delta people of Nigeria their other uses were slightly different from those of Ogii people. This study has shown more uses of these plants by the people of Ogii-Okigwe.

As the search for new drugs continues, other plant groups apart from the Angiosperms and gymnosperms need to be investigated also. Nwosu (2002) had listed some pteridophytes of medicinal value in Southeastern Nigeria, hence the need to investigate, isolate and characterize the active ingredients these lower plants contain. Furthermore, the medicinal properties of fungi species especially mushrooms like Ganoderma lucidum, Pleurotus tuberregium, Lentinus spp., have also been reported (Ofodile et al. 2011; Zoberi, 1973). These are the popular ones, there are still over eight species of edible mushrooms from Southeastern Nigeria (U. Igbokwe, 2009, personal communication). This study has highlighted the economic importance of the listed plants and their contributions the general healthcare of the people of Ogii-Okigwe. Further studies on mostly herbs and more shrubs, is underway to add to the medicinal plants database of southeastern Nigeria and the whole country as a whole.

#### **ACKNOWLEDGEMENTS**

I grateful to the numerous men and women whom I interview and who responded to the questionnaire especially the two popular traditional medicine practitioners Nze Ugwoagbara Igbokwe and Mrs. Philomena Ohiaeri who patiently took me through the uses of each of the plants and also confirmed the statements of other respondents.
